LINKEDIN POST

Thanks Kevin for picking up this issue and bringing it to the forefront.

The use case is strong, but moving off of WPA3 being required for 6GHz is also quite strong, and I don't see that going away... ever.

This all could be preempted by a 'Enterprise' vs 'Home' tag on Wi-Fi gear... Or it could have been preempted by having 802.1X capability required for Wi-Fi certification. But those are both water under the bridge.

At this point, the difficulty would be more technical, though solvable, since multiple vendors have solutions of a sort. So now it is more political to get vendors with varying interests to somehow agree on a 'standard'.

Hopefully, your bringing attention to this space will help move everyone forward to help find a solution!
