Have you ever seen on someone's website, or in one of their brochures, something like ISO 27001, and gone, what in the heck is that?

Well, what that means is they have met the requirements for a certification. They probably get a logo they can put on things. And it's saying they met certain requirements that some international standards body put together.

We've put together this graphic that lets you quickly see some of these, and realize which ones may or may not help you in your career and what you're doing with Wi-Fi.

The reason we have the standards isn't so you can break them. It's so you know what they are, so you can look at your customers, see what they need you to do, and continue to meet the requirements they need. That's why we made this graphic for you to learn from.

So go ahead. Take this. We made it a PDF so you can download it, print it, and keep it next to you for the next time you find someplace where you need to meet one of these standards.

Are there any standards that you failed to meet and then got in trouble on? I've been there.
